E-Commerce Inventory Management System

Project Description

The E-Commerce Inventory Management System is a database project developed using SQL. It manages products, categories, suppliers, customers, orders, and inventory stock.

Objectives

- Manage product information and prices.
- Track available stock quantities.
- Store supplier and customer details.
- Maintain customer order records.
- Identify products with low stock.
- Calculate the total inventory value.

Technologies Used

- SQL
- MySQL
- OneCompiler

Database Tables

1. Categories
2. Suppliers
3. Products
4. Customers
5. Orders
6. Order_Items

Features

- Product and category management
- Supplier information management
- Customer order tracking
- Inventory stock monitoring
- Low-stock identification
- Inventory value calculation
- SQL JOIN operations
- Stock quantity updates

How to Run

1. Open MySQL or a compatible SQL environment.
2. Open the "ecommerce_inventory.sql" file.
3. Execute the SQL statements.
4. View the query results.

Learning Outcomes

This project demonstrates the use of SQL tables, primary keys, foreign keys, INSERT statements, SELECT queries, JOIN operations, aggregate functions, and UPDATE statements.
